

Edge 2 Software Release, Version 4.4.5

Edge 2 software release 4.4.5 brings performance improvements, bug fixes, and a new feature addition with compatibility with Commander 24 fans. This update includes dedicated settings and curve data specifically designed to optimize performance with your new Commander 24.

Important Note: When updating your fan type to the Commander 24 in configuration, Edge 2 will automatically clear the information from your existing fan setting, and current fan settings from that fan will be removed in the ventilation grid. To ensure a seamless transition, we recommend taking a moment to document your current settings and grid before changing fan types.

In 4.4.5, Only 0-10 curves are available in the release. If you require 10-0 curves for your Commander 24 fans, you can use “10-0 default.” 10-0 Commander 24 curves will be included in a future release.

4.4.5 Release Information

Feature Enhancements:

- Expanded fan types to include Commander 24 new options.
- Introduced three 0-10 Commander 24 curves for enhanced control.
 1. Commander 24 with Cone
 2. Commander 24 No Cone
 3. Commander 24 No Cone Wind Deflector
- Implemented default OLED light and dark mode swapping for improved visibility and longevity.

Bug Fixes:

- Resolved issues with down menu functionality in current monitoring for some users.

Performance Improvements:

- Enhanced responsiveness of stir fans across ventilation stages.
- Improved interaction of attic vents when fans are in timer mode.

Please contact your District Manager if you have any questions.
