# Edge 2 Software Release, Version 4.5.1

We are pleased to announce the release of Edge 2 software version 4.5.1, featuring updates to support an upgraded component on our MPU boards. This release includes new software and firmware tailored for a new Wi-Fi module.

Key Updates:

- The software and firmware will automatically detect the Wi-Fi module in your controller.
- It ensures compatibility by selecting the appropriate version for optimal performance.

Important Notice:

- New MPU boards come pre-installed with software version 4.5.1.
- Before replacing an MPU board, we recommend downloading software version 4.5.1 to ensure seamless operation. Controllers running version 4.5.1 require all connected controllers to use the same version, avoiding potential delays or compatibility issues.
- Please note that **reverting to earlier software versions is not supported**. Controllers with the new MPU board must operate on version 4.5.1 or higher.
- To ensure reliable connectivity, the new Wi-Fi module requires a **2.4 GHz Wi-Fi network**. This frequency offers the most stable and consistent performance.
- Verify that **all controllers are connected to a 2.4 GHz network** to avoid connectivity issues.

Please contact your District Manager if you have any questions.
